

# Technology Stack [Architecture & Stack]

|               |  |
|---------------|--|
| Date          | 31 October 2022  |
| Team ID       | PNT2022TMID51008   |
| Project Name  | Exploratory Analysis of Rainfall Data in India for Agriculture |
| Maximum Marks | 4 Marks  |

## Technical Architecture:

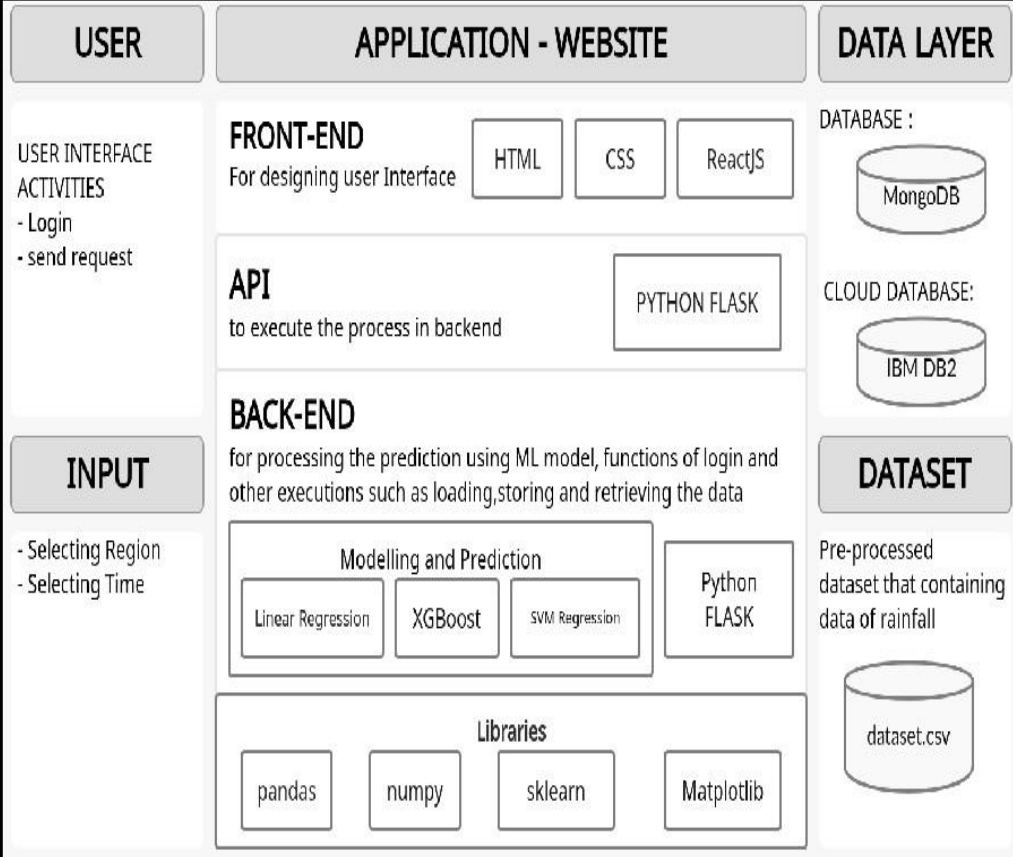

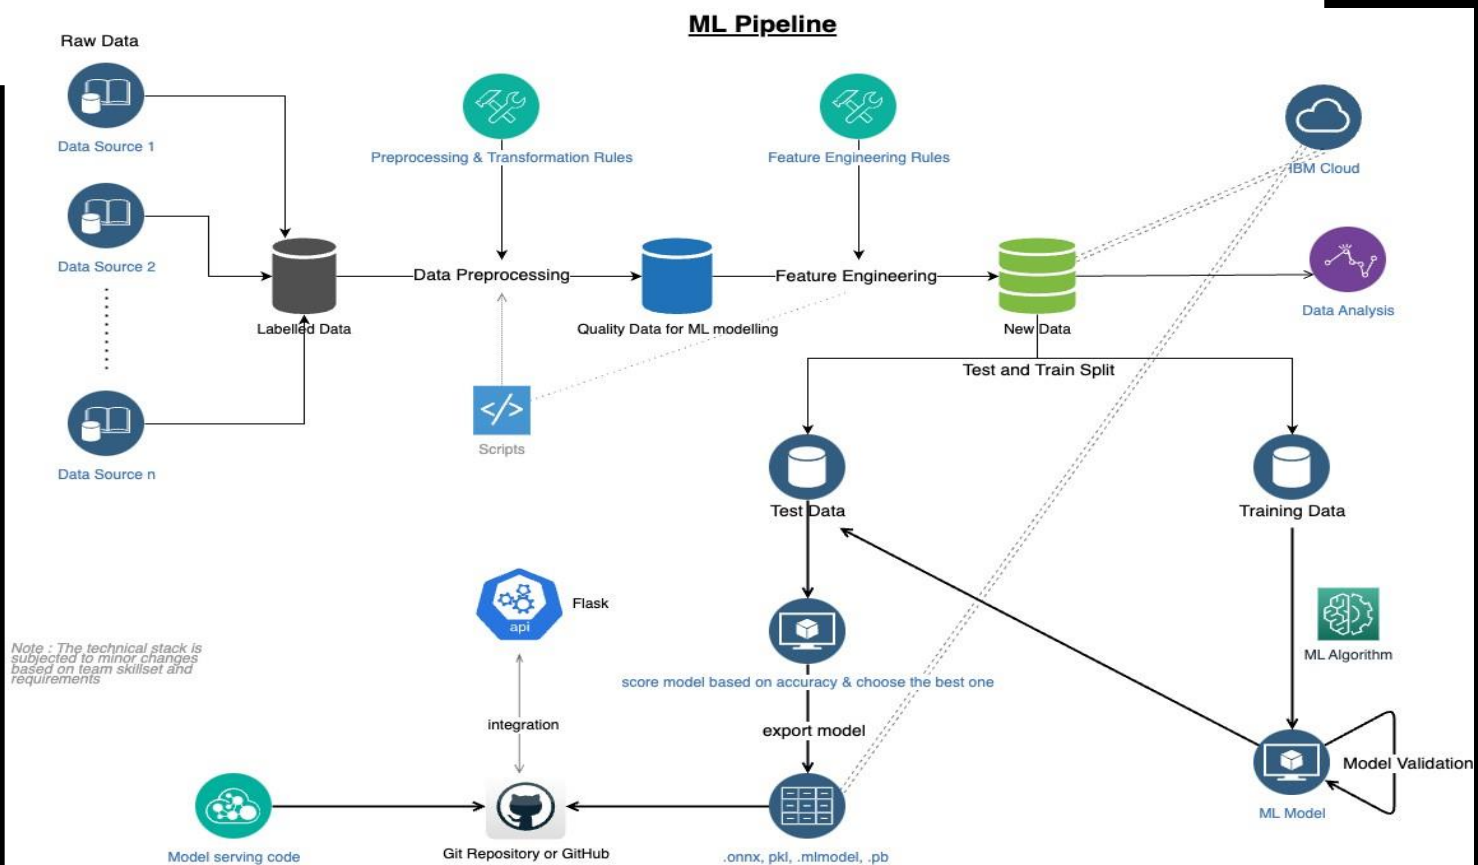

Table-1: Components & Technologies

| S.No | Component                        | Description   | Technology                                    |
|------|----------------------------------|---|---|
| 1.   | User Interface                   | How user interacts with application<br>e.g., Web UI, Mobile App.  | HTML, CSS, JavaScript, Bootstrap, React JS    |
| 2.   | Database                         | The place where data can be stored and retrieved during<br>the execution of the application             | CSV Store, NoSQL                              |
| 3.   | Cloud database                   | Used for integrating components while using python flask  | IBM DB2, IBM Cloudant                         |
| 4.   | API                              | Used to call the functions in order to access the execution<br>in another framework                     | Python Flask , NodeJS (if needed)             |
| 5.   | Application Logics               | Logic for each and every process in the application   | Python, JavaScript                            |
| 6.   | Machine Learning Model           | The model is developed to predict the rainfall using ML<br>algorithms                                   | Sklearn Regressors, ML Algorithms, XGBoost    |
| 7.   | Data Pre-processing and Analysis | The available data is formatted or converted into the format<br>which will be suitable for the ML model | Numpy, Matplotlib, Pandas, Seaborn, Geopandas |

Table-2: Application Characteristics

| S.No | Characteristics          | Description  | Technology  |
|------|--------------------------|--|---|
| 1.   | Open-Source Frameworks   | Backend Framework, Non-structured Database, CSS<br>Framework styling   | Python Flask / Node JS, MongoDB, IBM DB2, CSS-3           |
| 2.   | Security Implementations | Email Verification and authentication, Authentication and<br>authorisation using JSON object by comparing the data<br>exists in database | SSL Certs, Direct verification using Backend<br>Framework |
| 3.   | Scalable Architecture    | To ensure that enough resource is allocated on the hosting<br>platform to keep up with demand  | IBM Cloud Kubernetes Service                              |
| 4.   | Availability             | The website will be made available by hosting it in cloud<br>hosting platforms   | Heroku cloud hosting (for testing) ,<br>IBM cloud hosting |
| 5.   | Performance              | Multiple prediction requests should be handled<br>simultaneously without affecting the speed and accuracy of<br>prediction               | Load Balancers and Distributed servers                    |
